

TYPO3 is a powerful Content Management System designed to enable technically unskilled users to upgrade the content of their websites or intranets anywhere, anytime.

Simple Operation

TYPO3 is designed to allow people with no web development skills to build professional, corporate strength websites and intranets. TYPO3 has an easy to use interface allowing users that only know how to use a word processor and a web browser create, publish and manage their own web projects in no time.

Freedom and Independence

Using open source software means your CMS is always under your management control. You don't depend on an exclusive vendor any more. You even own the source code!

Modular Design

Content management is only the start of TYPO3's utility. Its modular design allows functional extensions to be easily added to the system: basic editing, back-end user administration, front-end user administration, forms, search, news articles, newsletters, etc. Your imagination is the limit.

Customised Look & Feel

Any design can be integrated into the TYPO3 CMS framework allowing designers to use their tools or load their own designs and style-sheets to change any aspect of the site appearance. Other CMS frameworks like phpNuke have a fixed visual layout making all the websites created with it look very similar.

Cost Effective

As an Open Source product, TYPO3 is a very cost effective content management system. You don't have to pay for license or user fees.

Security

TYPO3 lets you restrict access in the back-end and the front-end. You can control the administrators of your website as well as visitors to the front-end. You can control the front access to an entire site or merely an area of a site thus allowing the construction of intranets and extranets. The system ensures that unauthorised individuals cannot access sensitive information. User accounts can be easily kept up to date with the built-in automated administration tools.

Collaboration

TYPO3 supports multiple authors with different access privileges. This allows businesses to have several people creating content for their website/intranet simultaneously even from distant locations as TYPO3 is a web application.

Data Backup

We backup our servers once a day and keep the backups for one year. If you want us to provide you with the yearly data of your website/intranet we can do it for you for a fee.

Training and Customer Service

Training is included in the price of the installation of your CMS. Free email and phone support are always provided as long as you keep renovating your annual contract with us.

Try it Yourself

If you want to try our TYPO3 based CMS go ahead download and print the manual located at: http://www.onqweb.com.au/demo/getting_started_with_typo3.pdf check the *Before you Start* section and you'll be on in no time. **Note:** the previous url should be without breaks, it had to be broken in three lines for space reasons.
